

Steps to run the AdClientLibrary:

- 1). Install all the dependencies using 'npm install'
- 2). Build the library using 'npm run build'
- 3). Now you can open the index.html file in the browser to see the results.
- 4). To run the test 'npm run test'

Different Patterns:

I have created this library as a browser library to show it as a demo using a html page so did use new wisp.AdLibrary() pattern. It can be possible to change it to include in another .js file.

In Index.js

```
module.exports = {  
  AdClientLibrary = AdClientLibrary  
};
```

some example.js file

```
import wisp from Index.js;
```

```
let myAdInstance = new wisp.AdClientLibrary({  
  'containerId': 'topBanner',  
  'updateInterval': 60  
});
```
